

OFF-GO

KMIT Compass Program VTO — Final Project Presentation

Team: Voore Risheel Kumar, Nida Madeeha, Pathan Sohail Khan

Salesforce Mentor: Rahul Kumar

3/9/2026

Project at a Glance

Problem

- Shuttle routes and timings are difficult for employees to discover.
- Employees have no simple way to request or reserve a shuttle seat.
- Admins lack visibility into shuttle usage and passenger details.
- Delays, cleanliness issues, and driver complaints are difficult to track centrally.

Solution Overview

- Off-Go is a role-based web platform that connects administrators, drivers, and employees throughout the shuttle journey.

Admin configures shuttles, routes, stops, schedules and resolve complaints

Employees request trips, receive shuttle updates and get near real time location updates

Drivers manage trip navigation, onboarding passengers, receive route path

Architecture & Tech Stack

Key Features

Feature 01

Smart Shuttle Booking

- View available routes, stops, and schedules
- Select pickup and drop-off points
- Reserve seats digitally
- Receive booking confirmation and digital pass
- Cancel bookings when required

Feature 02

Live Shuttle Tracking

- Drivers update shuttle locations during trips
- Employees and admins view shuttle positions on a map
- Display route progress, current stop, next stop, and ETA
- Provide near-real-time updates through WebSocket and polling support
- Notify users about trip status and shuttle movement

Feature 03

Fleet Operations & Complaint Management

- Admins manage shuttles, routes, stops, schedules, and drivers
- View passenger bookings, attendance, and shuttle utilization
- Drivers manage trips and passenger check-ins
- Employees report delays, cleanliness, and driver-related issues
- Admins review complaints and update their status

Challenges & Learnings

Technical Challenges

Multi-Role Map Integration

- Designed different map views for employees, drivers, and administrators.

Near-Real-Time Tracking

- Synchronized driver location updates across all three modules.

Route and Stop Mapping

- Encoded route paths and stop locations accurately on the map.

Key Learnings

- Designed role-specific experiences on top of a shared tracking service.
- Learned to separate location collection, location processing, and location visualization.
- Understood the importance of consistent coordinates, timestamps, shuttle IDs, and route IDs across modules.
- Improved handling of asynchronous data, loading states, stale location data, and connection fallback.
- Learned that map integration requires both backend route intelligence and frontend visualization logic.
- Recognized that near-real-time systems require synchronization, error handling, and clear data contracts between components.

The background is a solid blue color. In the top right corner, there is a decorative geometric pattern consisting of several squares and triangles in different shades of blue, creating a modern, abstract design.
